

### **Note on Changes Since Homework 3**

Since Homework 3, I've modified one of the unit tests.

Instead of testing for an edge case in which a handicap is lethal at all values, I instead decided to look at a case where the mutation rate is set to 0, and the initial value of the handicap is also zero. I chose to do this because (1) it is not biologically realistic that a handicap would be lethal at all values, and (2) it would be interesting to confirm that a non-zero mutation rate is necessary to drive the handicap to its maximum value.
